Hi,

I think it's a little late, but I have something that might help.

Go to: **Store->Themes**

On your theme select **Actions->Edit Code**

Under **Templates** open **customers/register.liquid**.

and paste this code anywhere under `</div>`

```
<div class="form-group">
    <label for="loginPhone">{{ 'customer.register.Phone' | t }} {% if required
!= "" %}<sup>*</sup>{% endif %}</label>
    <input type="number" name="customer[phone]" class="form-control" id="login
Phone" placeholder="{{ 'customer.register.Phone_form' | t }}">
</div>
```

```

<input type="text" name="customer[first_name]" class="form-control" />
</div>
<div class="form-group">
<label for="loginlastName">{{ 'customer.register.last_name' | t }} (X if required != '')</label>
<input type="text" name="customer[last_name]" class="form-control" id="loginlastName" placeholder="{{ 'customer.reg' />
</div>
<div class="form-group">
<label for="loginPhone">{{ 'customer.register.phone' | t }} (X if required != '')</label>
<input type="text" name="customer[phone]" class="form-control" id="loginPhone" placeholder="{{ 'customer.register.ph' />
</div>
<div class="form-group">
<label for="logininputEmail">{{ 'customer.register.email' | t }} (X if required != '')</label>
<input type="email" name="customer[email]" class="form-control" id="logininputEmail" placeholder="{{ 'customer.reg' />
</div>
<div class="form-group">
<label for="loginInputPassword">{{ 'customer.register.password' | t }} (X if required != '')</label>
<input type="password" name="customer[password]" class="form-control" id="loginInputPassword" placeholder="{{ 'cust' />
</div>
<div class="row">
<div class="col-auto">
<div class="form-group">
<button class="btn btn-border" type="submit">{{ 'customer.register.submit' | t }}</button>
</div>
<div class="col-auto align-self-center">
<div class="form-group">
<ol class="additional-links">
<li>{{ 'customer.register.cancel' | t }}</li>

```

Save and go to Locals then open **en.default.json** (or your website default language file)

look for **register** (Ctrl+F then type register) and add the new parameters with their translations.

To show the mobile number on the account page:

Under **Templates** open **customers/account.liquid**. and add this code:

```

<tr>
    <td>{{ 'customer.account.phone' | t }}</td>
    <td>{{ customer.phone }}</td>
</tr>

```

```

</tr>
<tr>
    <td>{{ 'customer.account.email' | t }}</td>
    <td>{{ customer.email }}</td>
</tr>
<tr>
    <td>{{ 'customer.account.phone' | t }}</td>
    <td>{{ customer.phone }}</td>
</tr>
{% if customer.default_address != nil %}
<tr>
    <td>{{ 'customer.account.address' | t }}</td>
    <td>{{ customer.default_address.address1 }}</td>
</tr>

```
